Barstow Miocene

V492 (Flamingo loc.)

~~Collected~~ August 18-19, 1951 Leonard Bessom, Richard Tedford

Moved 48 cubic feet of matrix following the clay stratum underlain by calcareous nodule and overlain by tuffaceous sandstone.

Got four (plus) fragments of bird bone and several mammal rodent and camel bones (Merychippus, Tomarctus and an Artiodactyl), also several gastropods/

V493

Small bones, a rabbit tooth, felid toe, Merychippus P2, bird coracoid.

This locality is 50 feet below V492 in an orgnge-brown tuffaceous sandstone (this tuffaceous ss interbeds with clay). About 18 miles south of V492, down the creek bed. Made surface scratch only
